Idea Bulut Solutions

Website guide & technical handover

BUILT TO BE SIMPLE TO MAINTAIN

Your website. Your content. A clear way to manage both.

How the site works, how to publish products and articles, and what has been done to help search engines and AI tools understand it.

THE SHORT VERSION

You do not need to change the website's design or write application code to add a blog post or product card. Add a small text file, add the images, check it, then publish an updated build.

CONTENT

Simple files

Each article and product has its own editable Markdown file.

WEBSITE

Ready-to-read pages

Pages are prepared during the build, including the text search engines need.

QUALITY

Built-in checks

Checks catch missing fields, invalid dates, missing images and broken internal content links.

Write the content → **Add the images** → **Check & publish**

> **What "Markdown" means:** a plain text file ending in `.md`. A short settings block at the top describes the content; the main text goes below it. Templates are already provided.

Inside this guide: 02 Add a blog post · 03 Add a product · 04 SEO improvements
05 Test results · 06 Everyday maintenance & launch checklist

01 · PUBLISH AN ARTICLE

Add a blog post without changing the design.

One article file and one featured image are enough to get started.

> **Before using any command in this guide:** open the project terminal and run `cd idea-bulut-website`. Run the commands from the folder containing package.json.

01 **Create the file.** Run the command below, or copy `content/blog/_template.md` to a new file such as `your-post-title.md`.

```
npm run new:post "Your post title"
```

02 **Add the image.** Put it in `public/images/blog/`. In the article, use `/images/blog/your-image.jpg` — leave out `public`.

03 **Fill in the settings and write the article.** Keep the title at 70 characters or fewer and the optional excerpt at 160 or fewer. Use quoted dates in `YYYY-MM-DD` format.

```
---
title: "Your post title"
excerpt: "A short introduction to the article."
date: "2026-10-15"
featuredImage: "/images/blog/your-image.jpg"
imageAlt: "Describe what the image shows"
author: "Idea Bulut team"
tags: ["salesforce-devops"]
draft: true
---

Write a short introduction here.

## Your first section

Write the main article here.
```

04 **Review, then make it visible.** Set `draft: false`, run `npm run check:content`, fix any reported issues, then save, commit and push the changes. Build and publish the updated website.

Formatting made easy

`##` creates a section; `###` creates a subsection. Code blocks get a copy button. Tables, quotes, image captions and a `> Key takeaway:` callout are supported.

Updated automatically

The blog listing, reading time, contents menu, related articles, page address, sitemap, RSS feed and AI-readable files update with the next build.

Editing an existing article? Keep its filename. Add `updated: "YYYY-MM-DD"` when revising it; use a date on or after the original publication date. Drafts are hidden everywhere.

02 · PUBLISH A PRODUCT

A new product card. The same consistent design.

The small icon, description, chips, button and large visual all come from one product file.

```
npm run new:product "Your product name"
```

Or copy `content/products/_template.md` to a new filename. Put the small icon and large visual in `public/images/products/`, then fill in the file. The example below is for a product with its own external website.

```
---
name: "Your product"
brand: "Idea Bulut"
description: "Explain clearly what the product does."
tags: ["Free to start", "Your category"]
icon: "/images/products/your-product-icon.png"
visual: "/images/products/your-product.png"
visualAlt: "Describe the product image"
visualBackground: soft
cta:
  label: "Discover your product"
  href: "https://your-product-website.com"
  external: true
order: 30
featured: true
status: coming-soon
hasPage: false
---
```

Three visibility switches

- `status: live` shows the product publicly.
- `featured: true` includes a live product in the homepage carousel.
- `hasPage: true` creates a product page on this website.

Card details

- Description: 160 characters maximum.
- `tags` are the small label chips.
- `cta` controls the button.
- Background options: `soft`, `white` or `navy`.

> **Change the order:** use 10, 20, 30 and so on. A product set to 15 appears between 10 and 20 on the Products page. The homepage intentionally keeps **re:target first**.

Ready to show it? Change `status` to `live`, run `npm run check:content`, then save, commit, push, build and publish.

Need a full product page later? Set `hasPage: true` and use the full template's optional features, FAQ and main text. For an internal button, use a real internal path and `external: false`. The two current products stay external: Toolbelt for Copado and re:target.

03 · WHAT HAS BEEN IMPROVED

Clear for visitors. Readable for search and AI.

The technical foundations help search engines find the site, identify its pages and understand the information on them.

CLEAR PAGE IDENTITY

Titles, descriptions & links

Each content page has its own search title, description and preferred page address. That preferred address is called a **canonical URL**. Old addresses redirect to an appropriate current destination.

READY TO BE READ

Content in the page source

Headings, text, links and FAQ answers are already in the HTML. Search engines and AI tools do not have to run the site's interactive features to read the main information.

ORGANIZED INFORMATION

Structured data

Machine-readable labels describe the business, website, services, breadcrumbs, FAQs, articles, listings and contact page. Future local product pages have their own software-product labels.

BETTER ANSWERS

Consistent FAQ content

The visible service FAQs and their search-engine labels use the same source. Questions use clear headings and direct answers, reducing the risk of conflicting information.

SHARING & ACCESSIBILITY

Images and page previews

Social-sharing titles and images are configured. Blog posts use their featured images. Images use responsive delivery, helpful descriptions where needed and defined dimensions to reduce page movement.

SAFER, CLEANER DELIVERY

Performance & browser checks

The site uses optimized images, managed fonts, compression, caching and security headers. Keyboard focus, reduced motion and labelled controls are supported. No analytics or tracking pixels were added.

Files that keep discovery up to date

File	What it does, simply
`/sitemap.xml`	A generated list of indexable site pages for search engines.
`/robots.txt`	Documents crawler access, including named search and AI crawlers.
`/llms.txt` & `/llms-full.txt`	A concise guide and a fuller content reference for AI tools.
`/feed.xml`	An automatically updated RSS feed of published blog articles.

What the terms mean: SEO supports search discovery; AEO supports understanding answers; GEO supports understanding by generative AI tools. These are technical improvements, not a guarantee of rankings, traffic, indexing or AI citations.

04 · THE RESULTS

Strong results. Measured, not assumed.

Google Lighthouse mobile tests were run against a local production build. Every tested page met the requested score targets.

Page tested	Performance	Accessibility	Best practices	SEO
Homepage	99	100	100	100
Salesforce DevOps	94	100	100	100
API versions article	93	100	100	100
Products listing	97	100	100	100

Scores are out of 100. Targets: Performance ≥90; Accessibility, Best Practices and SEO ≥95. The Products listing was tested because both current products are external, not local detail pages.

How stable and responsive were the pages?

Page	Main content paint (LCP)	Layout movement (CLS)	JavaScript blocking (TBT, lab)
Homepage	2.0 seconds	0	40 ms
Salesforce DevOps	3.1 seconds	0	60 ms
API versions article	3.1 seconds	0	70 ms
Products listing	2.7 seconds	0	50 ms

All four tested pages met the requested Lighthouse score targets. No layout shift was recorded on these pages during the mobile tests.

Checks completed beyond Lighthouse

- **Build, lint, type checks and content checks:** passed without warnings.
- **15 content pages:** checked for unique metadata, one H1, canonical URLs, headings, image attributes and internal links.
- **Page-source checks:** main content, FAQ answers and JSON-LD were present in server-rendered HTML. Local structured-data checks passed.
- **Publishing tests:** temporary blog and product entries appeared in their pages and the appropriate generated files, then were removed.
- **Discovery and delivery:** crawling files, redirects, security headers and the custom 404 were checked.

Recorded mobile lab results, not live-site field data. Scores vary by device, network and hosting. TBT is not real-user INP; INP was not measured. A 100 SEO score does not guarantee rankings.

05 · THE TECHNICAL ESSENTIALS

Know where things live. Publish with confidence.

The site uses **Next.js, React and TypeScript**. Main pages and published content are prepared at build time. A Next.js production server delivers them, handles redirects and optimizes images. Blog and product content need no separate database or CMS dashboard. Core content needs no environment variables.

What you want to change	Where to look inside idea-bulut-website
Articles and product details	`content/blog/` and `content/products/`
Images	`public/images/blog/`, `products/` and `brand/`
Site-wide details	`src/config/site.ts`
Menu and footer links	`src/config/navigation.ts`
Service FAQ answers	`src/data/faqs/`

Hide or remove content

Hide an article with `draft: true`. Hide a product with `status: coming-soon`. To remove one permanently, delete its file and update links pointing to it. Publish an updated build for the change to go live.

Keep existing links working

The filename becomes the page's address. Avoid renaming a published file. If its address must change, ask the developer to add a redirect from the old one.

The repeatable publishing checklist

Save the content and images → run the checks → fix errors → commit and push → build and publish. **Saving a file alone does not update the live site.**

```
npm run check:content     # Check the content files
npm run lint              # Check code quality
npm run typecheck         # Check TypeScript
npm run build             # Create the production build
```

Content checks run automatically before every production build. More commands are in the README.

Before treating the website as launch-ready

- **Approve the legal details.** Privacy and Terms are still drafts and remain excluded from indexing. Unresolved placeholder-dependent sentences are hidden, not replaced with invented facts.
- **Connect message delivery.** The contact form is intentionally disabled until delivery is configured. Discovery-call booking uses Google Calendar.
- **Confirm the live domain.** The configured default is `https://ideabulut.com`. Match the published domain to that setting; the setting alone does not prove the site is live.
